Subject: Building C Air Sampling due to Recent Flooding
Sampling and Analysis Summary
Middle River Complex, Middle River, Maryland

Dear Mr. Carroll:

Tetra Tech, Inc. (Tetra Tech) is submitting this letter to summarize the activities at Building C basement. On Friday July 14, 2017 at approximately 5:00 p.m., Mr. Justin Tetlow (Middle River Aircraft Systems [MRAS]) contacted Mr. Tony Apanavage (Tetra Tech) by text message stating that with the volume of rain that fell in the Middle River, Maryland area earlier that afternoon, storm water had come up through the floor in Building C basement at column M9

TestAmerica Laboratories, Inc. (TestAmerica) an

validation. There were no exceedances of the risk-based screening criteria for any chemical detected. Trichloroethene (TCE) or other chlorinated compounds such as 1,1,1-trichloroethene, *cis*- or *trans*-1,2-dichloroethenes, or vinyl chloride were not detected in any of the six samples.

Historically, woodblock shop flooring has been treated with creosote or coal tar products. Based upon the observed creosote odor, naphthalene was expected to be present; however, naphthalene was detected in only two samples (IA-C-1 and IA-SL-C-1) at low concentrations (2.7 micrograms per meters cubed ($\mu\text{g}/\text{m}^3$) and 2.4 $\mu\text{g}/\text{m}^3$, respectively).

Benzene, toluene, xylenes, and ethylbenzene (BTEX) compounds and trimethylbenzene compounds are often associated with oil, creosote, and coal tar. Oil could have also been used to preserve the woodblock flooring at the site, and all BTEX components were detected during sampling. Total xylenes were detected in all six samples at concentrations ranging from 0.1 to 20.4 $\mu\text{g}/\text{m}^3$.
